

Studies of baryonic matter at BM@N

P. Batyuk for BM@N Collaboration

Dubna, Joint Institute for Nuclear Research

Workshop on Physics at FAIR-NICA-SPS-BES/RHIC
(July 10-11, 2018)

Outline

- Nuclotron and physics to be investigated
- BM@N experiment
- Experimental results within the BM@N experiment
- Short Range Correlations program as an extension to the BM@N experiment

NICA Complex

- Set of accelerators providing particle beams for fixed target and collider experiments
- Experimental facilities
- Line for assembling and cryogenic testing of SC-magnets
- Workshops for construction of the detector elements
- NICA innovation center

Beams - $p, d \dots {}^{197}Au^{79+}$

Collision energy:

$$\sqrt{s_{NN}} = 4 - 11 \text{ GeV}, T = 1 - 6 \text{ AGeV}$$

Luminosity: $10^{27} \text{ cm}^{-2} \text{ s}^{-1}$ (Au),
 10^{32} (p)

- 2 interaction points - **MPD** ([ICNFP2018, report of V. Kolesnikov](#)) and **SPD**
- Fixed target experiment - **BM@N**
- **2018:** extracted beams of heavy ions (Ar, Kr) are available within the BM@N experiment
- **2020:** a first configuration of the MPD setup available.
- **2023:** commissioning of the fully designed NICA-complex is foreseen.

Nuclotron (in operation since 1993)

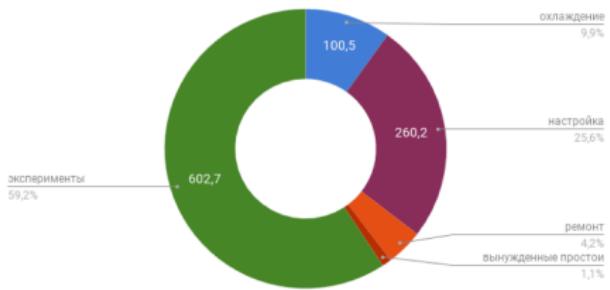

Modernized in 2010 - 2015

Parameters	Nuclotron
type	SC synchrotron
particles	$\uparrow p$, $\uparrow d$, nuclei
injection energy [MeV/u]	5 ($\uparrow p$, $\uparrow d$), 570-685 (Au)
max. kin. energy [GeV/u]	12.07 ($\uparrow p$), 5.62 ($\uparrow d$), 4.38 (Au)
magnetic rigidity [T · m]	25 - 43.25
circumference [m]	251.52
cycle for collider mode [s]	1.5-4.2 (active), 5.0 (total)
vacuum [Torr]	10^{-9}
intensity, Au [ions/pulse]	$1 \cdot 10^9$
spill of slow extraction [s]	up to 10

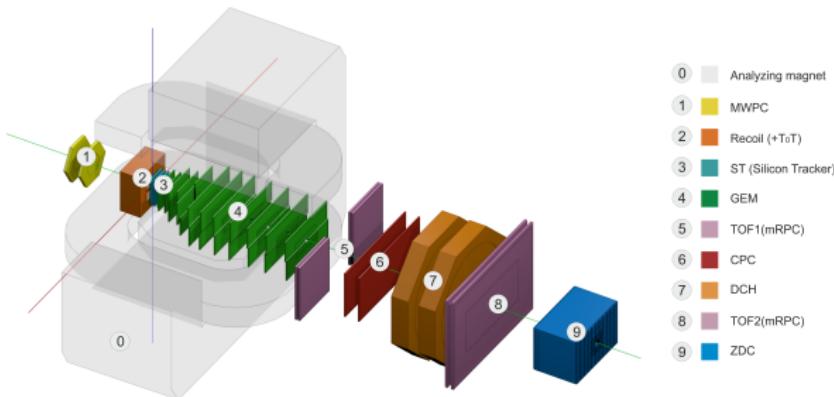

Run55: Feb - Apr, 2018

55 сеанс - время

BM@N experiment

Full setup, layout

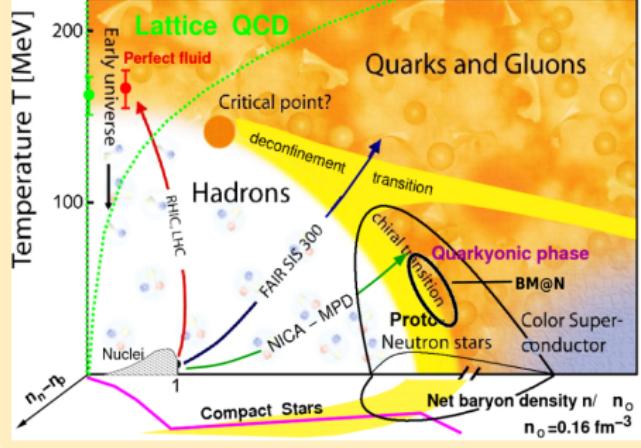

- Central tracker (Silicon tracker + GEM) inside analyzing magnet to reconstruct AA-interactions
- Outer tracker (CPC, DCH) behind magnet to link tracks from central tracker to ToF detectors
- TOF1 & TOF2 system based on mRPC and T0 detectors to identify hadrons and light nuclei
- Detectors to form T0 and beam monitors
- ZDC calorimeter to measure centrality of AA-collisions
- Electromagnetic calorimeter for γ , e^+ , e^-

BM@N advantages:

- large aperture analyzing magnet
- sub-detector systems are resistant to high multiplicities of charged particles
- PID: "near to magnet" (TOF1), "far from magnet" (TOF2)

QCD phase diagram

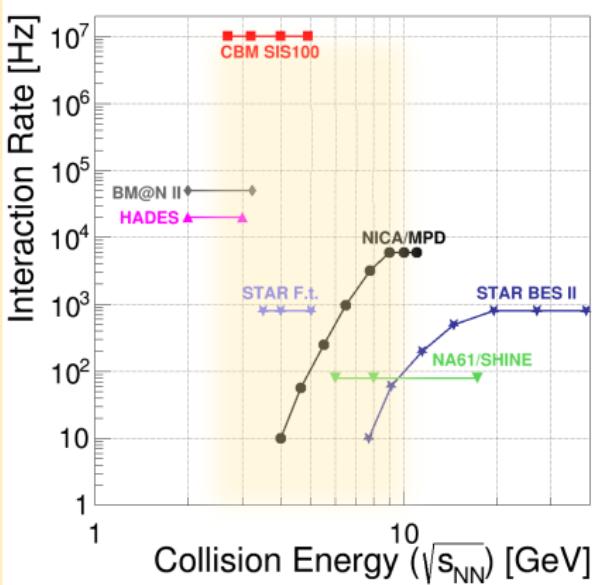

High energy:

- $N_{\text{baryons}} \approx N_{\text{antibaryons}}$
- Lattice QCD predicts crossover transition between hadronic and partonic matter
- ALICE, ATLAS, CMS, STAR, PHENIX

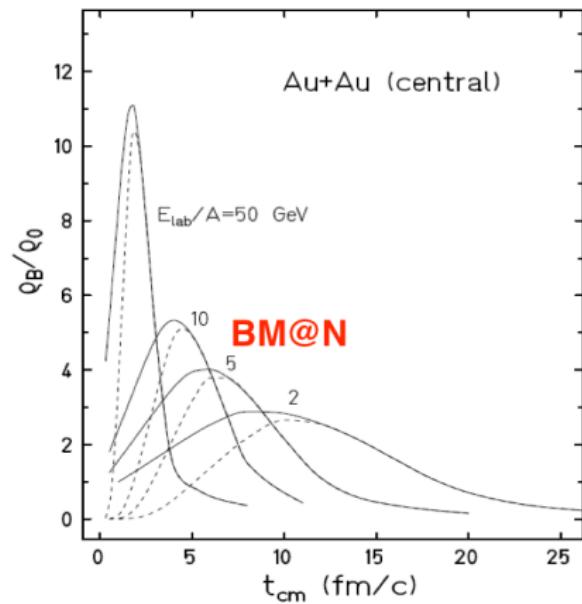

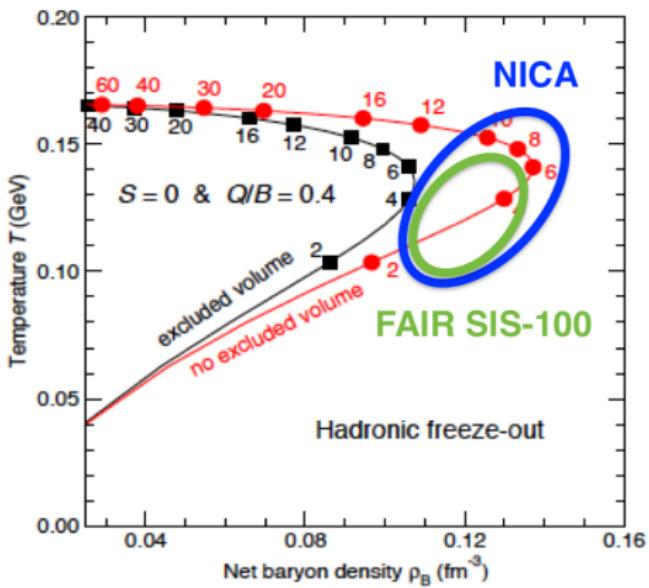

High net-baryon density:

- $N_{\text{baryons}} \gg N_{\text{antibaryons}}$
- Lattice QCD not applicable, models predict structures and exotic phases
- BES @ RHIC, NA61, CBM, NICA/MPD, BM@N

Landscape of experiments exploring QCD phase diagram

Exploring high density baryonic matter with Nuclotron

Nuclotron is well suited to study high density (dominantly baryonic) matter since at that energies baryon-dominated system exists comparatively long lifetime

Physics possibilities at the Nuclotron

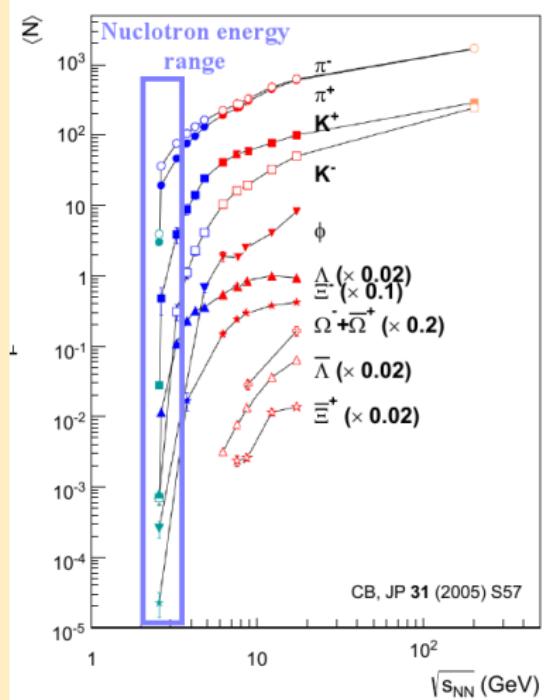

$A + A$ collisions:

- strangeness at threshold
- Need more precise data for strange mesons, hyperons and hypernuclei, multi-variable distributions, unexplored energy range

$p + p, p + n, p + A$ collisions:

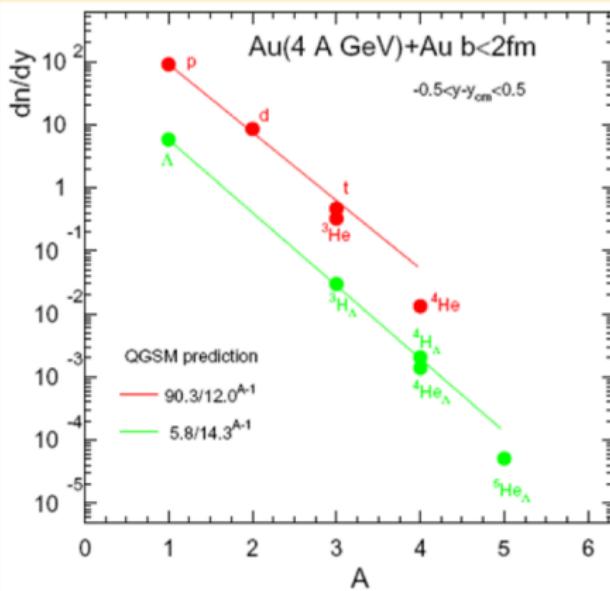

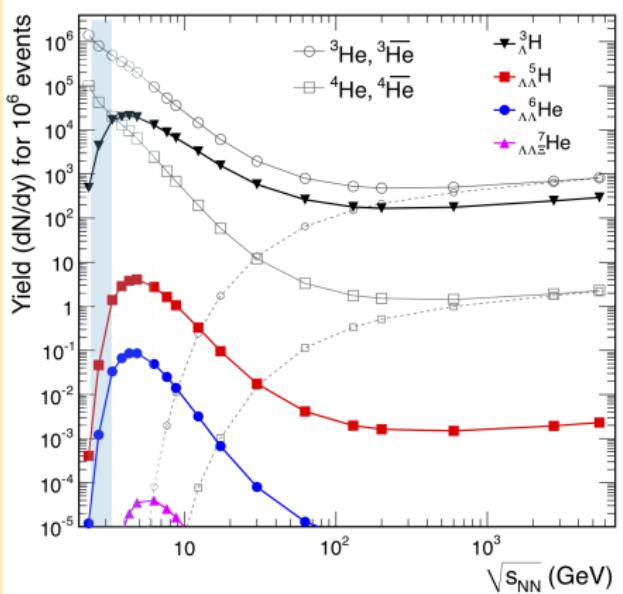

- Hadron production in elementary reactions and “cold” nuclear matter as a “reference” to determine exactly nuclear effects

AGS NA49 BRAHMS

Heavy ions $A + A$: Hypernuclei production

A. Andronic et al., Phys. Lett. B697 (2011) 203

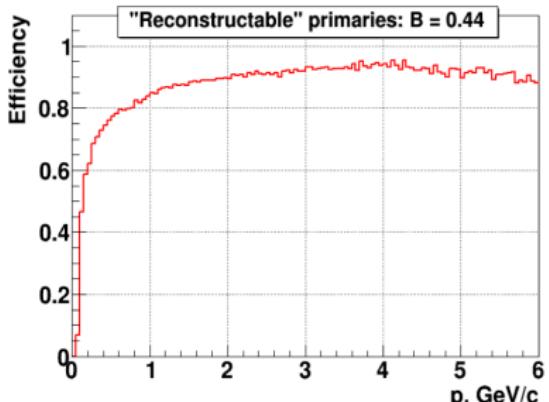

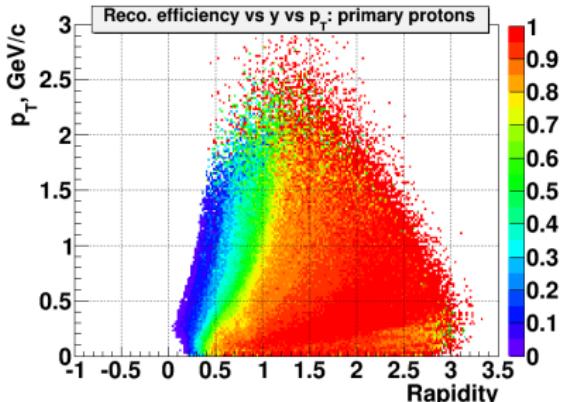

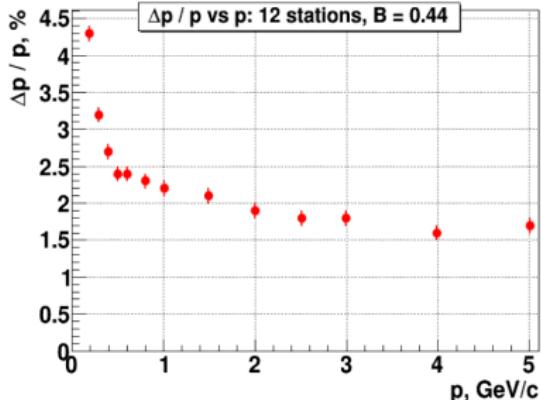

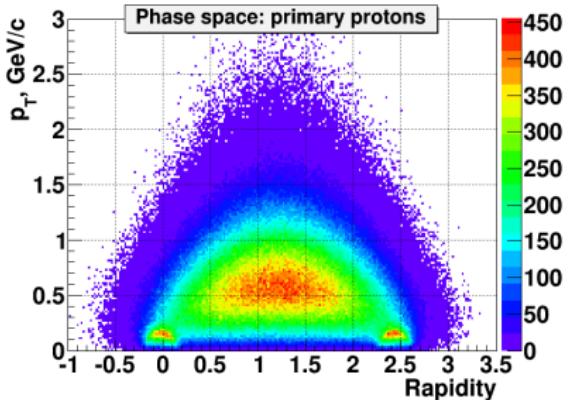

BM@N energy range is suited
for the search of (double)
hypernuclei

- In heavy-ion collisions: production of hypernuclei through coalescence of Λ with light fragments enhanced at high baryon densities
- Maximal yield predicted for $\sqrt{s_{NN}} = 4 - 5 \text{ AGeV}$ (stat. model)

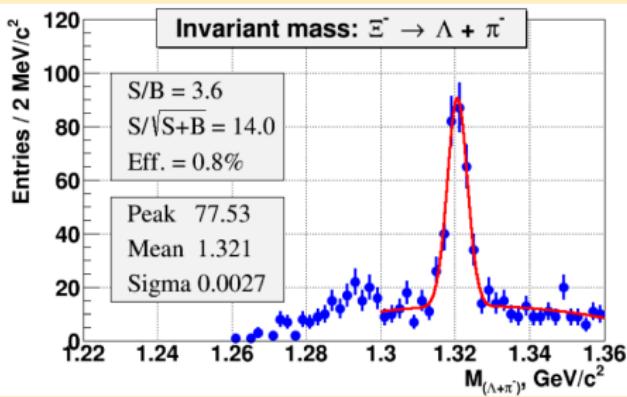

BM@N feasibility study, GEM tracker performance

Acceptance for primary photons, mom. resolution, det. efficiency

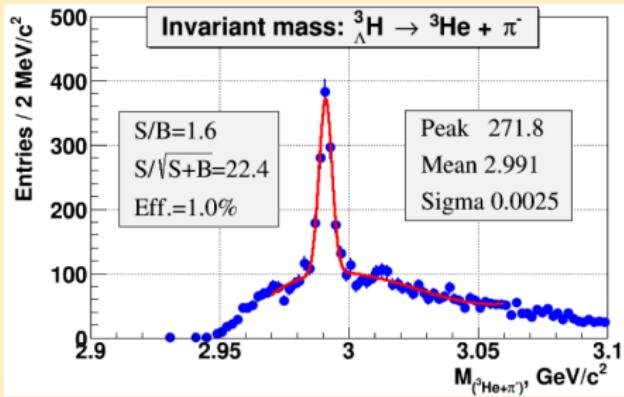

Simulation: UrQMD & DCM-QGSM, Au+Au, T = 4.5 AGeV

900k central events,
7.5M Ξ^- in 1 month
20 kHz trigger

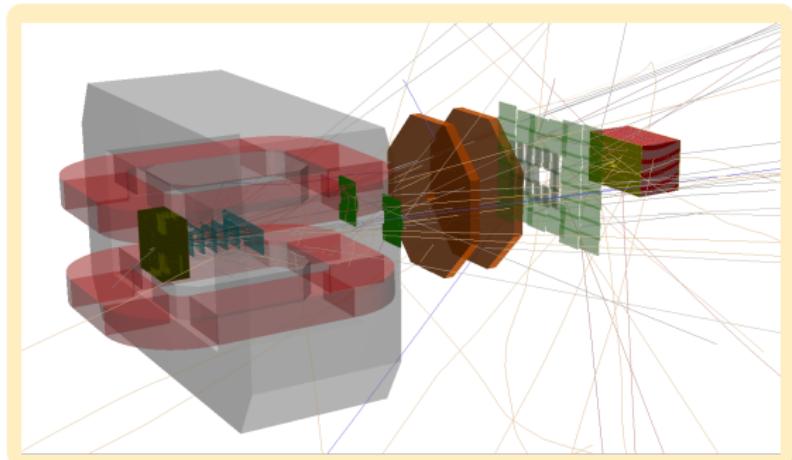

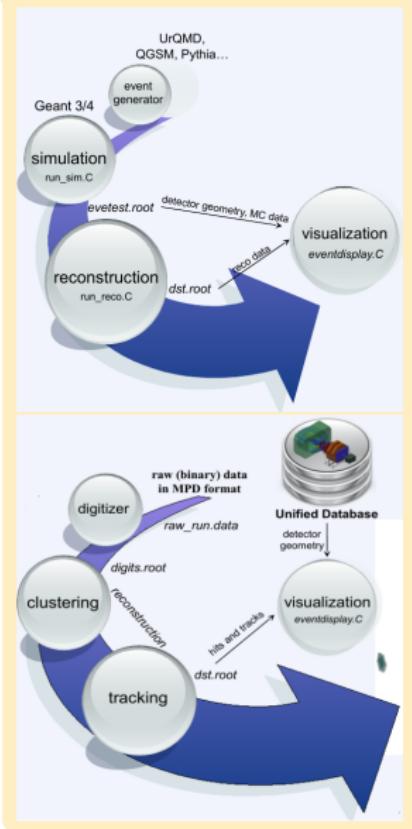

2.6M central events,
8.5M $^3\Lambda$ H in 1 month
20 kHz trigger

The feasibility study indicates reliable reconstruction of cascades and hypernuclei of order of 10 millions per month

Data processing for offline Event Display

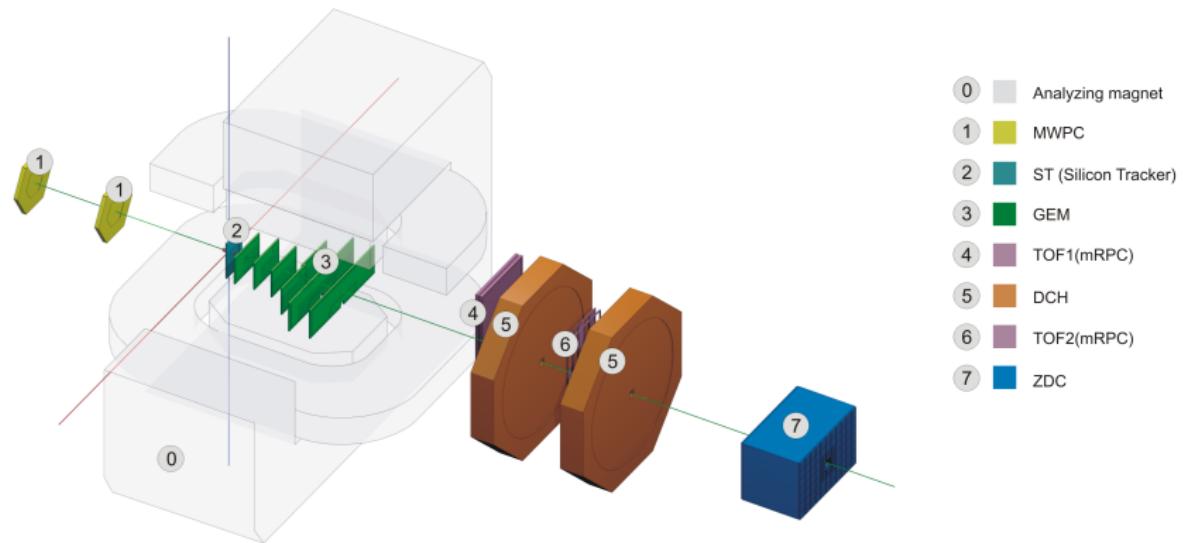

Sim & Reco

- The Event Display has been developed for graphical representations of the NICA experiments in offline as well as online mode and integrated into the BmnRoot software.
- The visualization system gives an opportunity to visually check the developed algorithms for reconstruction and physical analysis of data.

Some experimental results from deuteron and carbon runs

Setup & Experimental program to be performed

Input beams:

Deuteron beam (d),
 $T = 4.0, 4.6 \text{ AGeV}$
Carbon beam (C),
 $T = 3.5, 4.0, 4.5 \text{ AGeV}$

Aims:

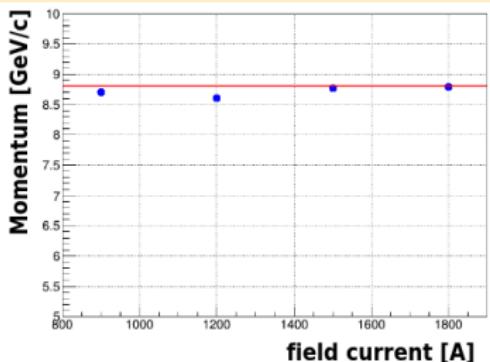

- Focus on tests and commissioning of central tracker inside analyzing magnet → GEM detectors and forward Si detector for tracking
- Test / calibrate ToF, trigger detectors, calorimeters

Program:

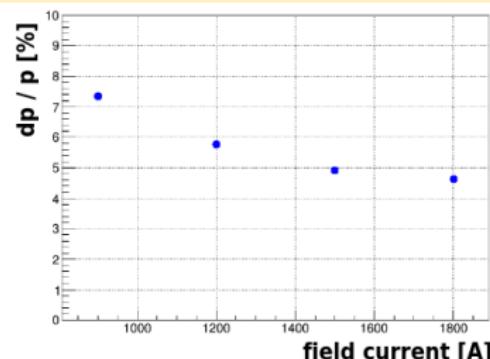

- Trace beam through detectors, align detectors, measure beam momentum in mag. field of 0.3 - 0.85 T
- Measure inelastic reactions d (C) + target → X with deuteron and carbon beam energies of 3.5 - 4.6 GeV/n on targets CH_2 , C, Al, Cu, Pb

Beam momentum measured with GEM tracker in carbon run

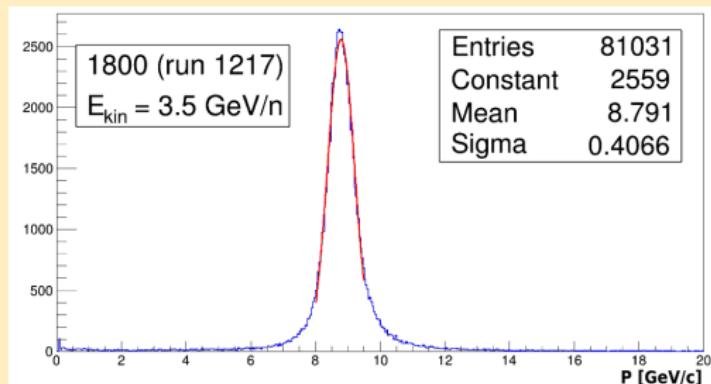

p vs. field current

$\Delta p/p$ vs. field current

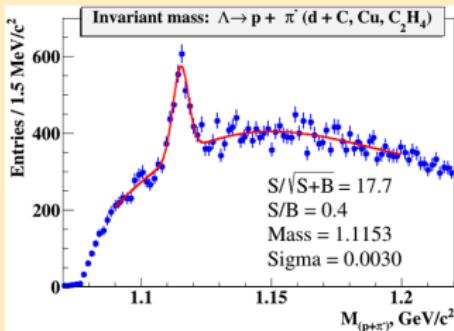

- Reconstruction of carbon beam trajectory and momentum in GEM detectors at different values of magnetic field
- Gas mixture: Ar + CO_2 (70:30)
- Carbon beam run, $T = 3.5$ AGeV

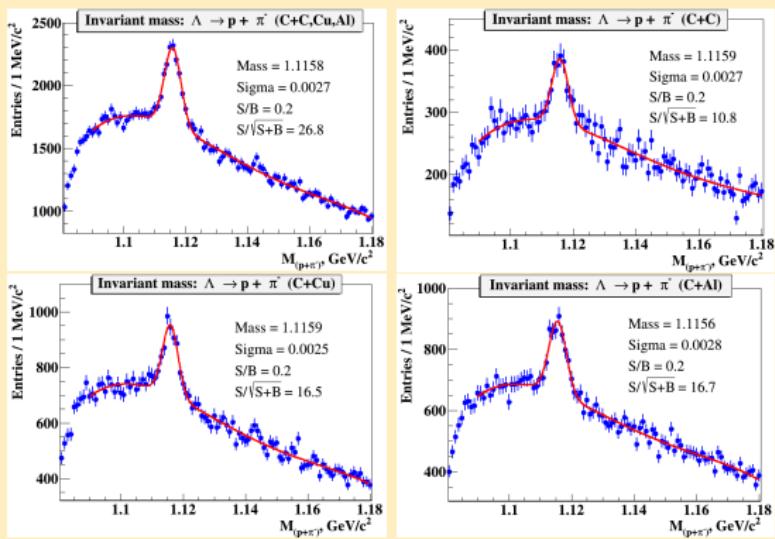

Λ^0 in deuteron and carbon runs

d (C) + target $\rightarrow X$
 Λ^0 -signal width $\sim 2.5\text{-}3$ MeV

Deuteron run

Carbon run, T = 4 AGeV

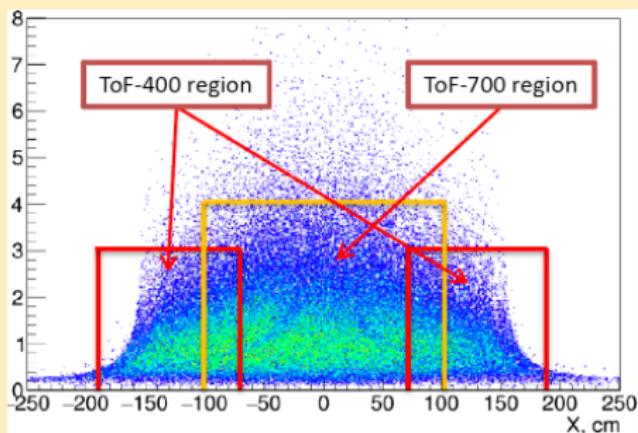

PEPAN Lett., v.15,
p.136, 2018(2): First
results from BM@N
technical run with
deuteron beam

To improve vertex and momentum resolution and reduce background under Λ^0 :

- Need few planes of forward Silicon detectors \rightarrow 3 planes used in last run
- Need more GEM planes to improve track momentum reconstruction

TOF1 and TOF2 based on mRPC

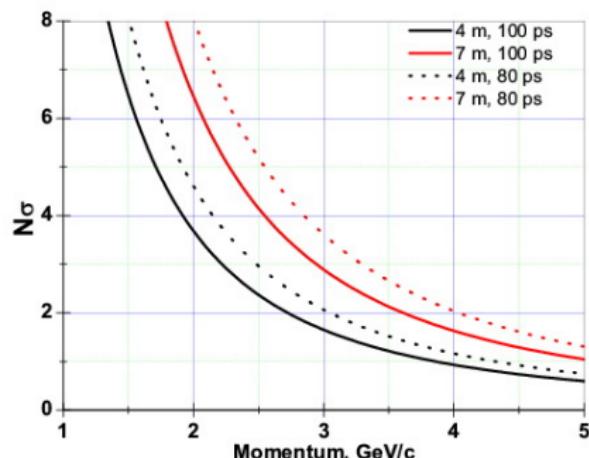

AuAu @ T = 3.4 AGeV, π^\pm , 4m from target

Requirements to TOF system:

- high granularity to keep the overall system occupancy below 15% and minimize efficiency degradation due to double hits
- operation at high particle flux

Separation of π/K for different time resolution and bases

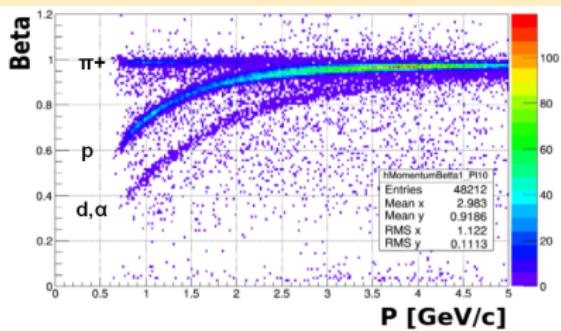

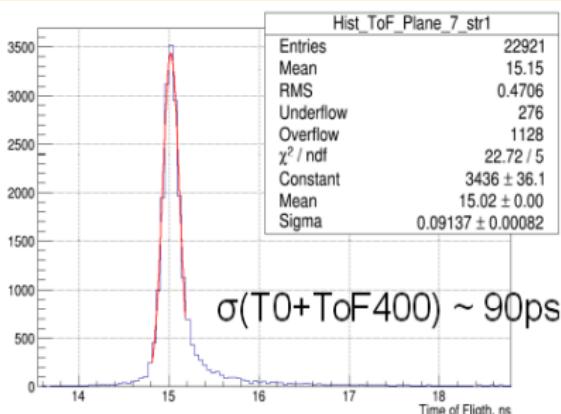

- time resolution better than 80 ps
- high combined geometrical and detection efficiency (better than 95%)

TOF1 and TOF2 performance in carbon run

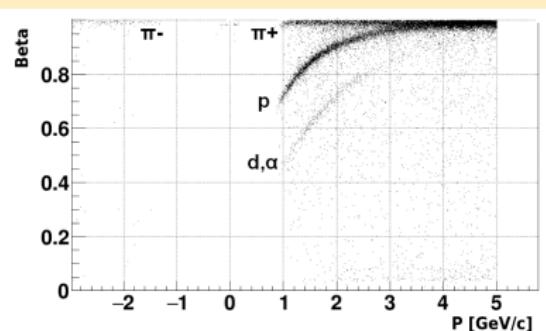

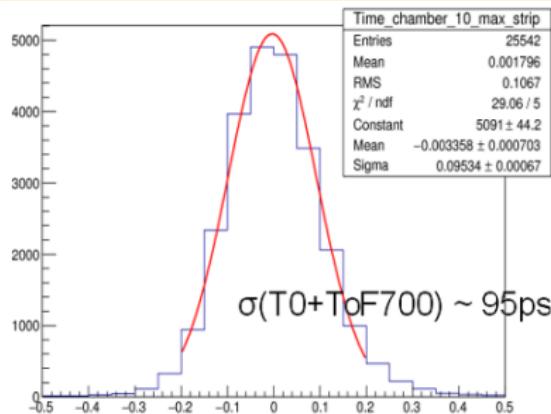

$T = 3.5 \text{ GeV/n}$, $\text{C} + \text{Al} \rightarrow \text{X}$

Includes inf. from GEM tracking

$T = 4.5 \text{ GeV/n}$, $\text{C} + \text{Cu} \rightarrow \text{X}$

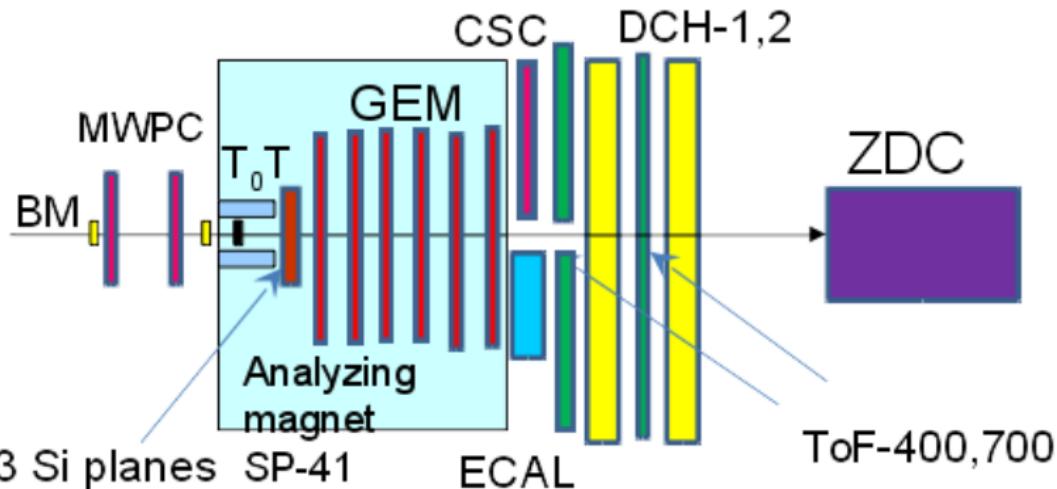

Includes inf. from GEM and DCH trackings

**And what about the last
run on March 2018?**

**Data analysis is in progress,
but nevertheless...**

Setup & experimental program to be performed

Input beams:

Ar beam, $T = 3.2 \text{ AGeV}$
Kr beam,
 $T = 2.4, 3.0 \text{ AGeV}$

Aims:

- Central tracker inside analyzing magnet \rightarrow 6 GEM detectors $163 \cdot 45\text{cm}^2$ and forward Si strip detectors for tracking
- Test ToF system, trigger detectors, hadron and EM calorimeters, outer tracker supplemented by CSC

Program:

- Measure inelastic reactions Ar (Kr) + target $\rightarrow X$ on targets Al, Cu, Sn, Pb
- Hyperon production measured in central tracker (Si + GEM)
- Charged particles and nuclear fragments identified with ToF
- Gamma and multi-gamma states identified in ECAL

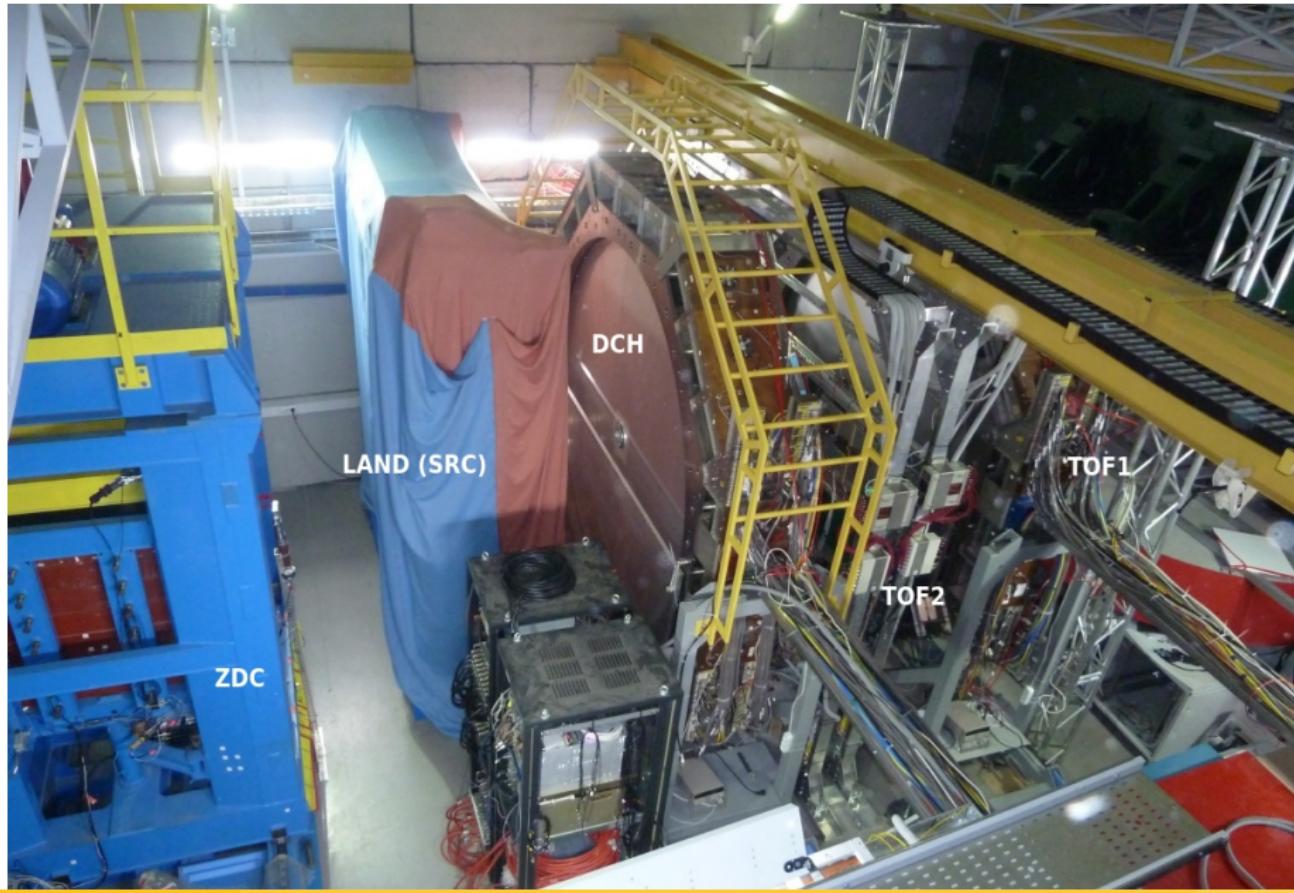

BM@N setup in the last run (before magnet)

New detector components:

- Six big GEMs
- Trigger detectors
- Three Si detectors
- CSC chamber
- Full set of TOF detectors

BM@N setup in the last run (behind magnet)

BM@N and SRC, data collected (March 23 - April 5)

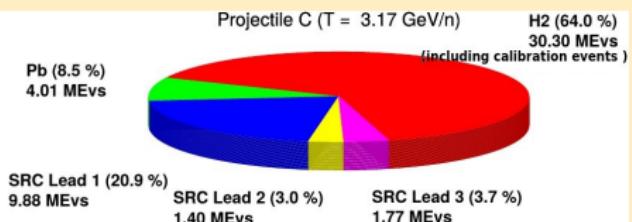

SRC:

- One beam energy available for C-beam
- More than half of the collected statistics can be used for analysis

BM@N:

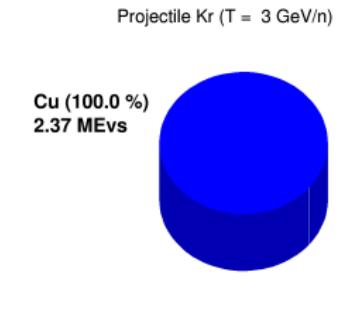

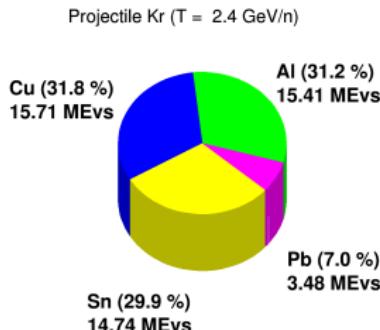

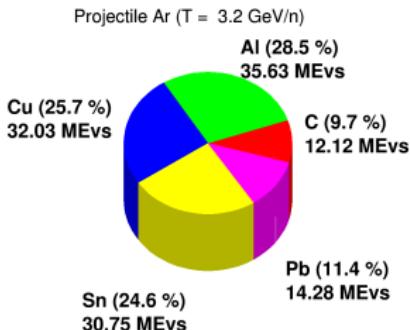

- One beam energy available for Ar-beam and three - for Kr-beam
- Wide set of targets used (C, Al, Cu, Sn, Pb)

SRC

Data analysis is in progress ...

BM@N

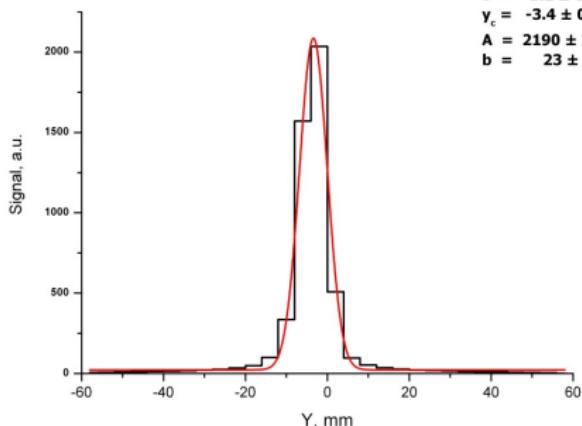

BM@N beam profile

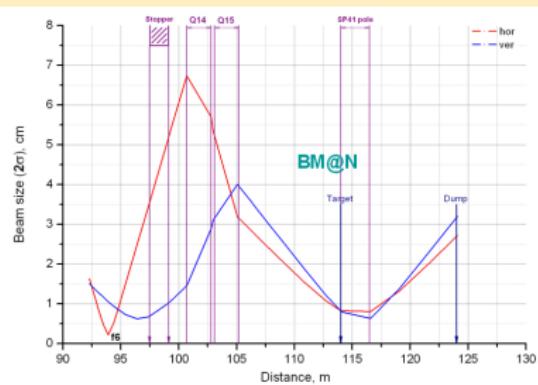

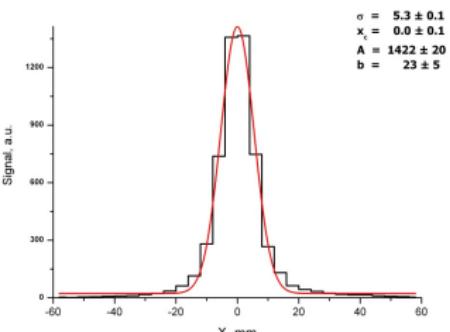

Beam profiles measured by beam group

	C, Spring 2017	Ar, Spring 2018	Kr, Spring 2018
$\sigma_x [mm]$	6	5	5.3
$\sigma_y [mm]$	4.9	5	3.2

Kr beam, Y-profile

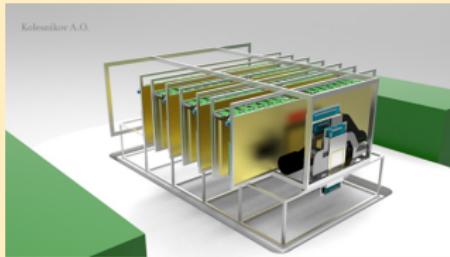

Kr beam, X-profile

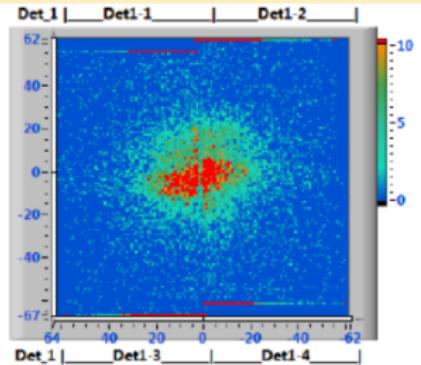

Forward silicon strip detectors

Central tracker (GEM +
SI) in Argon/Krypton run

Kolesnikov A.O.
Kr beam fragments in
silicon vertex detector

- Two-coordinate Si detector with strip pitch of $95/103\mu\text{m}$, full size of $25 \cdot 25\text{cm}^2$
- Detector consists of 4 sub-detectors located around beam
- 2 smaller vertex detectors (March 2018)

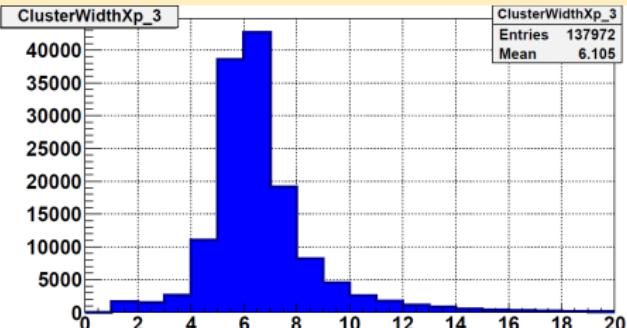

New Cathode Strip Chamber (CSC) as Outer tracker

Argon (krypton) run:

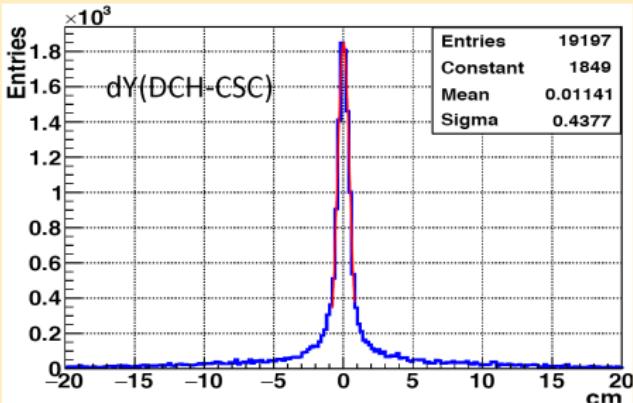

CSC chamber installed in front of TOF1
to check its performance as Outer tracker
for heavy ions

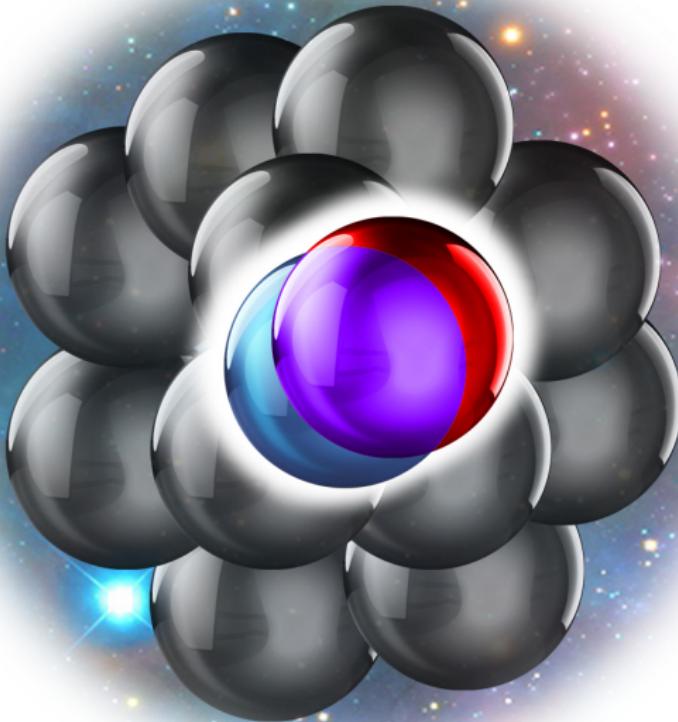

Average cluster size:

Matching between CSC and DCH:

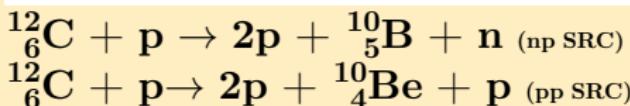

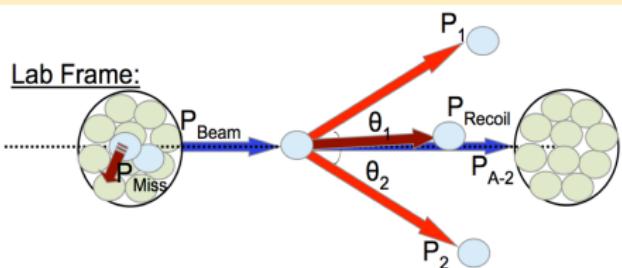

Short Range Correlations (SRC) @ BM@N

How to study SRC?

Inverse kinematics

Participants

- JINR: BM@N
- Israel: Tel Aviv University
- Germany: TUD and GSI
- USA: MIT
- France: CEA

TECHNISCHE
UNIVERSITÄT
DARMSTADT

Super exclusive measurement!

Four particles detected:

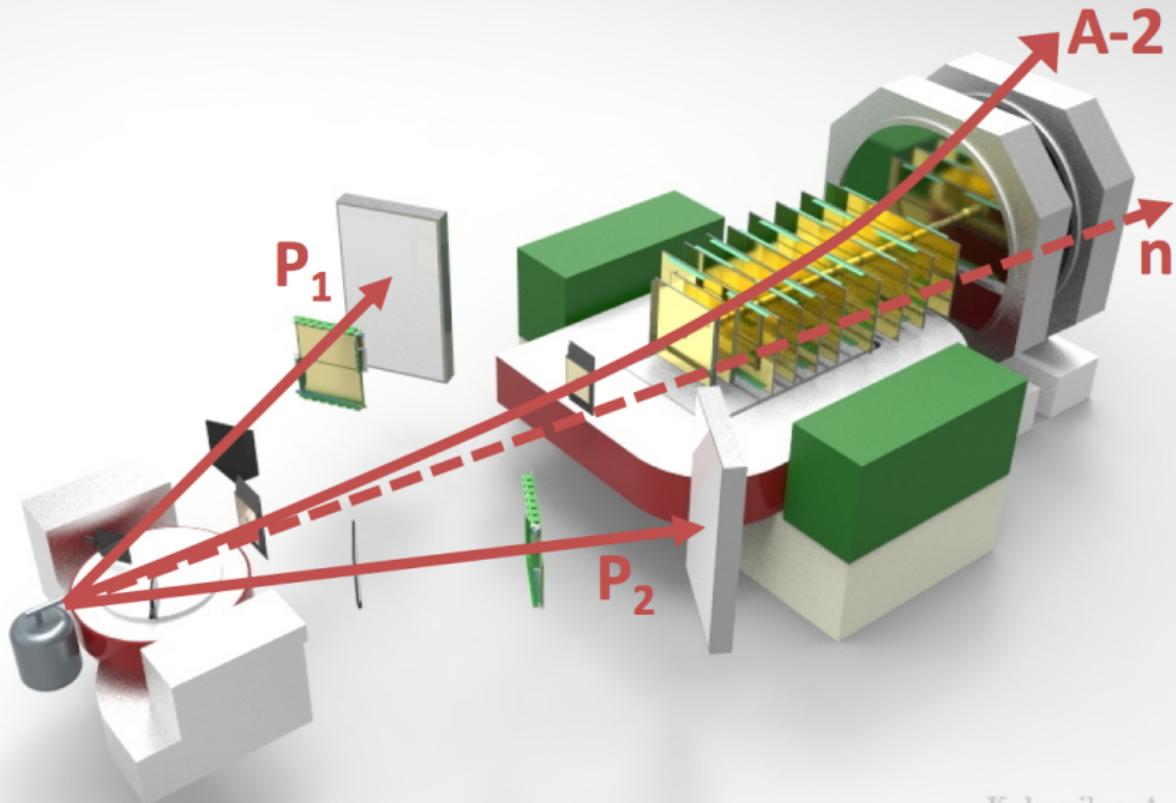

- scattered probe
- knocked-out nucleon
- recoil
- (A-2)-fragment system

Objectives

- identifying 2N-SRC events with inverse kinematics
- studying isospin decomposition of 2N-SRC
- studying (A-2) spectator nuclear system

First BM@N SRC program run in March 2018: ~ 30 MEvents collected

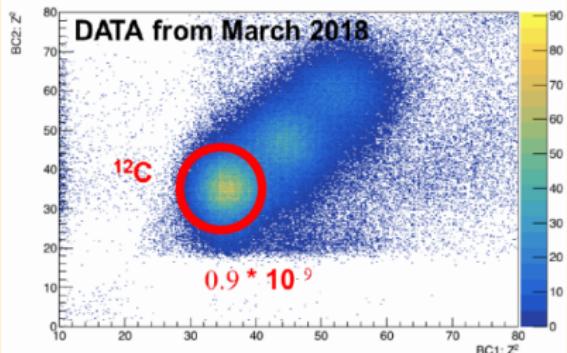

Experimental setup

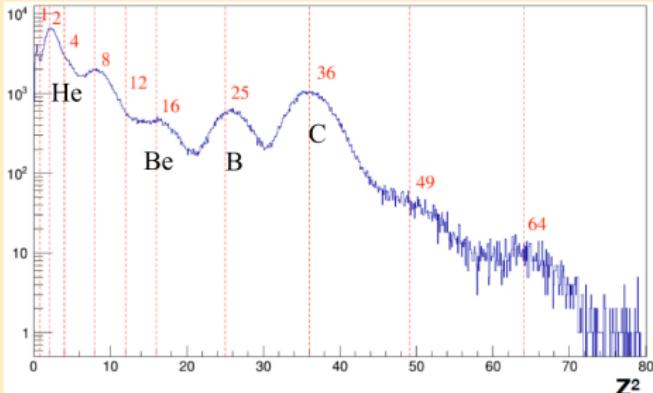

Kolesnikov A.

Counter analysis (A - 2) identification

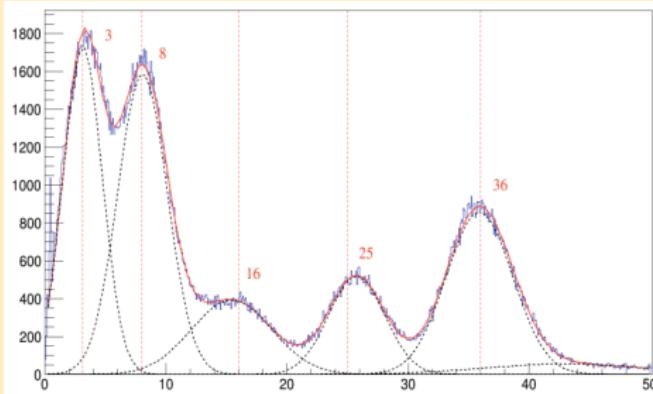

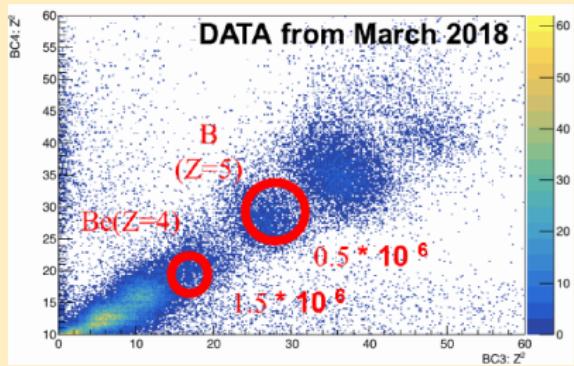

Before target:

Nuclear fragment identification

After target:

BM@N: past & future, status & plans

Beam parameters and setup at different stages of the experiment

Year	2016	2017	2018	2020	2021 and later
Experim. status	techn. run	techn.run	techn. run	stage 1, phys.	stage 2, phys.
Beam	d(\uparrow)	C	Ar, Kr, C	Au	p, Au
Max. intensity [MHz]	0.5	0.5	0.5	1	10
Trigger rate [kHz]	5	5	10	10	20-50
Central tracker					
GEM	6 (half planes)	6 (half planes)	6 (half planes)	7	7
SI	-	1 (small plane)	3 (small planes)	4	4

Status:

- Technical runs with deuteron and carbon beams ($T = 3.5 - 4.6 \text{ GeV/n}$), argon beam ($T = 3.2 \text{ GeV/n}$) and krypton beam ($T = 2.3 \text{ GeV/n}$) performed
- Measurement on Short Range Correlations with inverse kinematics: C + H₂-target performed
- Major sub-systems are operational, but are still in limited configurations: GEMs, forward Silicon detectors, Outer tracker, ToF, ZDC, ECAL, trigger, DAQ, slow control, online monitoring
- Algorithms for event reconstruction and analysis are being developed

Plans:

- Collaborate with CBM to produce and install large aperture silicon detectors in front of GEM-tracker
- Extend the GEM central tracker and the CSC outer tracker to full configuration
- Implement beam detectors into vacuum beam pipe, implement vacuum / helium beam pipe through the BM@N setup

Conclusion:

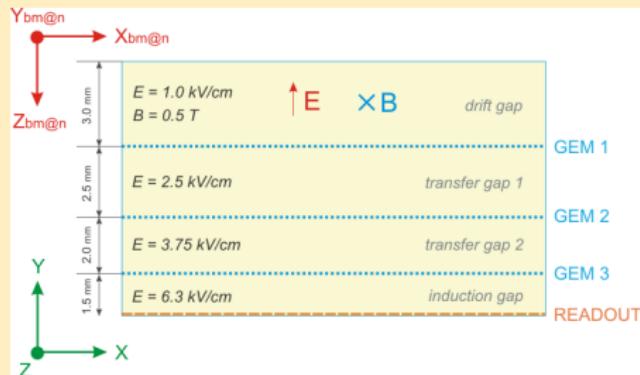

- BM@N experiment has recorded experimental data with carbon, argon and krypton beams at several energies and on several targets.
- Minimum bias interactions have been analyzed aimed to reconstruct tracks, primary and secondary vertices using central GEM and Si tracking detectors.
- Reconstructed signals of Λ^0 and K_s^0 are visible in proton-pion and pion-pion invariant mass spectra.
-

Towards realistic simulation of GEM tracker

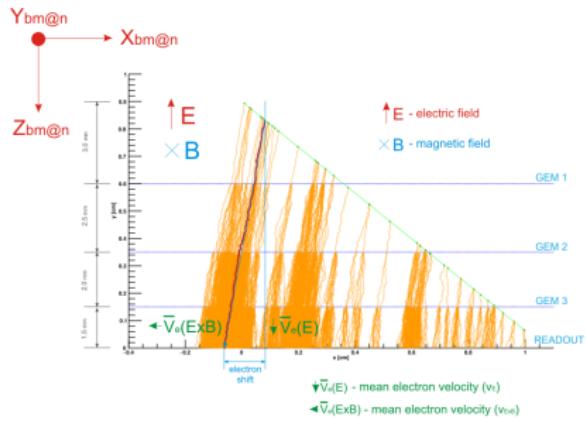

Simulation of GEM response: Garfield++

- **Garfield++** is a framework for micro-simulation of physical processes in gas detectors
- A charge particle passing through GEM chamber detecting volume ionizes electrons in gas
- Multiplayer GEM-cascades form avalanches which drift to readout-plane and fire strips

Simulation parameters in Garfield++

Structure of BM@N GEM chamber and simulated electron avalanches

Profile of electron avalanche at the readout-plane (cluster)
